The gene was placed in operable linkage with the al-3 promoter (see AAT03005). The al-3 gene controls the production of geranyl geranyl pyrophosphatase (GGPP) synthetase. GGPP is a precursor for carotenoids and xanthophylls. It has been shown that exposure to light increases the transcription level of GGPP synthetase 15-45 fold. Light activates a number of genes in the common bread mould, Neurospora. This can be used to regulate the expression of genes encoding heterlogous proteins, e.g. chymosin, in recombinant production systems. Use of a light-regulated promoter is a simple and effective way to control expression and allows timing to be adapted to the physiological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid for expression of heterologous protein - contains albino promoter for light induced expression in filamentous fungi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The inventors claim the prochymosin gene comprising a nucleotide sequence from (a) the 1st codon (GCT) to the 365th codon (ATC), or (b) the 5th codon (CGG) to the 365th codon (ATC); and recombinant plasmids harboured by Escherichia coli strains deposited as FERM BP-262, -263 and -264. Any portion of the nucleotide sequence as described in AAN40055 can be used. Also claimed is a vector derived from plasmid pBR322. Typically plasmid pCR501 is obtd. from pOCT 2. The transcriptional direction of pOCT 3 is opposite to that of pOCT 2; it is clockwise in pOCT 2 (5' to 3') whereas counter
         The inventors claim isolated chymosin (rennin) and prochymosin generation calves, and plasmids conty. the genes which are capable of replicating in a prokaryotic organism. The prokaryotic organism is pref. an Escherichia species, esp. E. coli p Gx 1225 (NRRL B-15061) The microorganisms transformed by the plasmid are also claimed.
                                                                                                                                                                                                                                                                                                                                                                 CDS
                                                                                                                Isolated chymosin or rennin and prochymosin genes - which replicate in prokaryotic organisms, esp. Esche and organisms used for chymosin biosynthesis
                                                                                                                                                                                                                                  13-APR-1983;

                                                                                                                                                     The DNA encoding prochymosin can be cloned into a plasmid (esp. fros. cremoris SK112) and used to produce large amts of the protein by recombinant DNA techniques. This could overcome the shortage of prochymosin due to shortage of calf stomachs and increasing cheese prodn. Prochymosin is also used in prodn. of yoghurt, butter and buttermilk. The gene may be ligated into plasmid poGE21 and expressed in E. coli. The resulting expressed enzyume is a well known milk-clotting enzyme used in cheese-making.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The inventors claim a DNA segment contg. GAL1 promoter linked to gene - useful for direction of expression of the gene in yeast. The recombinant material carrying a GAL1 promoter of the yeast galactokinase gene may be used in expressing a desired protein, bovine growth hormone, interferon, prorennin or preprorennin, in yeast cell. Strains of Saccharomyces cerevisiae producing the polypeptides are produced. Yeast strains deposited as ATCC 2064: 20661, 20662 and 20663, strain designations CGY 196, 457, 461 and 20663.

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR amplified cDNAs from pools of ,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 34048B-345479, and 48448B-489479."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil pal groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and

                                                                                                                                                                                                                             The present sequence represents the bean phaseolin promoter, which is used to construct plasmids for the expression of the P. putida faoAB gene. The gene encodes an enzyme that may be used in the method of the invention. The specification describes a method for manipulating the metabolism of a plant, and comprises expressing a heterologous gene encoding fatty acid oxidation enzymes in the cytosol or plastids other than the peroxisomes, glyoxisomes or mitochondria of the plant. The method may be used to enhance the biological production of polyhydroxyalkanoates or novel oil compositions in a transgenic plant. Plants which may be used to produce these compounds in this way include Brassicas, maire, soybean, cottonseed, and the plant market sor normal cottonseed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3901
